

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. Ideation Phase

College Project Documentation

1.1 Project Idea

The project proposes an automated IT procurement process for standard laptop orders. Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer uses ServiceNow Flow Designer to reduce manual work when an employee requests a standard laptop.

1.2 Problem Statement

Traditional laptop procurement may involve repeated emails, manual approvals, checking stock information, creating tasks, and updating request records. These steps can cause delays, inconsistent processing, and avoidable administrative effort.

1.3 Proposed Solution

Create a standardized request process in which an employee submits a laptop request, the system validates the request, obtains the required approval, creates procurement or fulfillment tasks, and updates the request automatically.

1.4 Objectives

- Standardize laptop-order processing.
- Reduce repetitive manual activities.
- Route approvals to the correct person or group.
- Create fulfillment tasks automatically.
- Improve tracking and visibility.
- Maintain a clear record of request activities.

1.5 Scope

The project covers standard laptop requests, request validation, approval, task creation, status updates, notifications, and basic tracking. Non-standard hardware, complex procurement negotiations, and physical delivery operations are outside the initial scope.

1.6 Expected Outcome

A repeatable and traceable workflow that demonstrates how Flow Designer can automate a common IT procurement scenario while keeping users, approvers, and fulfillment teams informed.
