

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

2. Requirement Analysis

College Project Documentation

2.1 Stakeholders

Role	Requirement
Employee / Requester	Submit a standard laptop request and view its progress.
Manager / Approver	Review and approve or reject the request.
IT Procurement Team	Process the approved procurement requirement.
IT Fulfillment Team	Prepare and assign the laptop for delivery.
System Administrator	Configure the catalog item, flow, roles, notifications, and testing.

2.2 Functional Requirements

1. Provide a standard laptop request form. 2. Capture requester, laptop type, quantity, justification, and required date. 3. Validate mandatory information. 4. Trigger the automation when a request is submitted. 5. Send approval to the appropriate approver. 6. Continue only after approval. 7. Create procurement/fulfillment tasks automatically. 8. Update request status at major stages. 9. Notify relevant users about important status changes. 10. Record activities for audit and tracking.

2.3 Non-Functional Requirements

The solution should be reliable, easy to maintain, secure according to platform roles, understandable to users, and capable of handling standard requests consistently.

2.4 Business Rules

Only complete standard laptop requests should enter processing. Approval is required before fulfillment. Rejected requests must stop the fulfillment path and record the decision.

2.5 Inputs and Outputs

Inputs include requester details, laptop specification, quantity, justification, and required date. Outputs include approval records, fulfillment/procurement tasks, notifications, status changes, and an auditable activity history.
