

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

3. Project Design Phase

College Project Documentation

3.1 System Architecture

The design uses a request interface connected to ServiceNow records and a Flow Designer automation. The flow acts as the orchestration layer between the request, approval, task creation, notifications, and final status update.

3.2 Main Components

• Service Catalog / request form • Request and requested-item records • Flow Designer flow • Approval action • Task creation actions • Notifications • Assignment groups • Status and activity tracking

3.3 Process Flow

Employee submits request → Validate request → Send approval → Decision If approved → Create procurement/fulfillment task → Assign to responsible team → Update status → Notify requester → Complete. If rejected → Update request as rejected → Notify requester → End.

3.4 Data Design

Field	Purpose
Requested For	Identifies the employee receiving the laptop.
Laptop Model / Type	Identifies the standard device requested.
Quantity	Number of devices requested.
Business Justification	Reason for the request.
Required Date	Expected date for fulfillment.
Approval Status	Stores approval result.
Fulfillment Status	Tracks processing progress.

3.5 Error Handling

If mandatory information is missing, the request should not proceed. If an approval is rejected, the flow follows the rejection path. If a task cannot be assigned, the issue should remain visible through the request/task record for administrator review.
