

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

7. Project Demonstration

College Project Documentation

7.1 Demonstration Objective

Demonstrate the complete lifecycle of a standard laptop order from request submission to approval and fulfillment-task creation.

7.2 Demonstration Sequence

1. Log in with a requester account. 2. Open the standard laptop request. 3. Enter valid sample details. 4. Submit the request. 5. Show that the automation is triggered. 6. Log in or switch to the approver context. 7. Approve the request. 8. Show the automatically created procurement/fulfillment task. 9. Show assignment and status updates. 10. Display the final request history/activity.

7.3 Rejection Demonstration

Repeat the request process with a second test record and reject the approval. Show that the approved fulfillment path is not created and that the requester receives the rejection/status update.

7.4 What to Explain During Demo

Explain the trigger, conditions, approval action, decision paths, task creation, assignment, notifications, and how the request can be tracked. Highlight how automation replaces repetitive manual routing.

7.5 Expected Demonstration Result

The audience should be able to see a complete, traceable flow in which a standard laptop request is processed consistently and the correct next action is generated automatically.

7.6 Viva Points

- Why Flow Designer? — To automate and orchestrate process steps with configurable actions.
- Why approval? — To ensure the request is authorized before fulfillment.
- Why task creation? — To assign actionable work to the responsible team.
- What happens on rejection? — The fulfillment path stops and the decision is recorded.
- What is the main benefit? — Consistent, trackable, less manual processing.
